

IS SECURITY FALLING BEHIND?

Today, virtually every business in the world relies on software to stay competitive. As companies sprint to release products and services, they are also relying on rapid application development cycles to keep up. As more software is brought to market, application vulnerabilities continue to escalate. And security, as always, struggles to keep pace.

If new software releases, mounting data breaches and changing risk vectors have you scratching your head wondering where to even start with your security program, it is time to consider the ZeroNorth solution for Rapid AppSec. ZeroNorth is the security industry's first provider of risk-based vulnerability orchestration across applications and infrastructure, and we can help you accelerate critical security initiatives.

Businesses need to find ways to integrate security tools into their existing digital environments without impacting the speed of business, while also trying to understand and manage where risk across the organization might be. These challenges are particularly acute for companies with immature or resource-stretched AppSec programs, as they risk exposing their critical business applications (and themselves) to threat. They lack the coordinated visibility to execute consistent, comprehensive security scans across all layers of their software development lifecycle (SDLC).

Finding ZeroNorth

For companies with limited cybersecurity and AppSec resources, ZeroNorth delivers key capabilities that enable customers to jump-start and accelerate critical security initiatives. Specifically, the ZeroNorth platform provides

WHEN IT COMES
TO SECURING
APPLICATIONS,
DOES YOUR
ORGANIZATION
STRUGGLE
WITH...

A lack of application
security resources?

Potential risk to critical
business applications?

An immature or non-existent
Application Security program?

free-to-use scan tools—SCA, SAST, DAST, container and cloud management—to enable security across both the development and operational phases of the SDLC. As the first company to deliver risk-based vulnerability orchestration across applications and infrastructure, ZeroNorth helps customers make sense of fragmented workflows among development and security teams, while ensuring the scalability of application and infrastructure security occurs quickly, affordably—and effectively.

The ZeroNorth solution for Rapid AppSec enables organizations to reduce business risk by quickly integrating security scanning across the SDLC. By embedding open source scan tools directly within the ZeroNorth platform, customers can jump-start critical application security initiatives without depending on complex and expensive commercial offerings.

Our unified platform for executing and managing security, while also uncovering vulnerabilities through scanning, reduces the management burden and eliminates the need to manually evaluate, deploy and manage disparate scanning and testing tools. This means time-strapped security teams can refocus their efforts and skills on more business-critical priorities, while rapidly scaling the security of new applications and infrastructure.

Key benefits of the solution include:

- 1 An integrated platform to centrally manage and execute all application security scans, while addressing remediation
- 2 The ability to identify vulnerabilities and prioritize risk across applications and infrastructure
- 3 A way to validate security of applications deployed across AWS environments via open source cloud management scanning
- 4 A comprehensive set of open source security scanning tools to jump-start or expand application security programs including:
 - SCA for open source components
 - SAST for developers' code
 - Container scanning for container misconfigurations and vulnerabilities
 - DAST for vulnerabilities within deployed software

Learn how your organization can accelerate application security and reduce risk at every stage of the SDLC.
