

ZeroNorth DevSecOps Analytics & Reporting for the Board, Business, Security & DevOps

To do their jobs, CISOs today must have a complete picture of enterprise-wide application security and the ability to communicate effectively with executives and the Board on the organization’s risk and compliance posture. For product owners, business unit leaders and development teams, AppSec visibility is also critical as they are accountable for the risk inherent in their products. They need roll-up reports – with granular drill down – to quickly determine what vulnerabilities to prioritize for remediation. And if a breach occurs, long-term data on AppSec can help with forensic analysis to determine root cause and responsibility.

But CISOs and their security staff continually struggle to gain critical visibility into application security across the enterprise. Security is becoming more decentralized, and DevOps teams are now handling at least some AppSec scanning, often with their own tools of choice. While AppSec scanning is often inconsistent, it generates an unwieldy amount of granular – and disparate – vulnerability data. As a result, it’s nearly impossible to determine where the greatest risk to the business lies, let alone communicate this information in a meaningful and easily consumable format across teams and with executives.

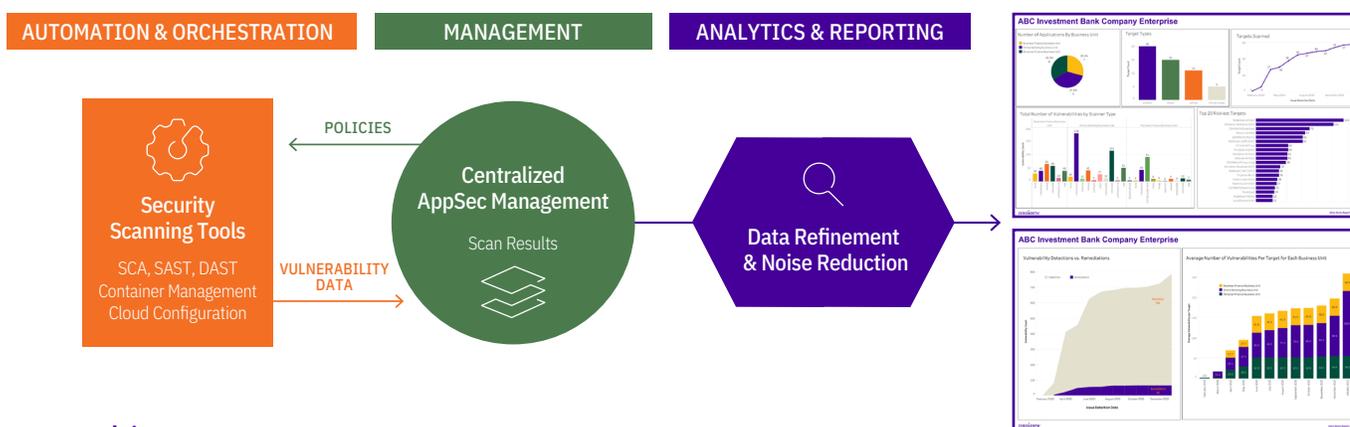

A SINGLE SOURCE OF TRUTH ON APPSEC RISK

A SaaS platform, ZeroNorth DevSecOps Analytics and Reporting helps enterprises rapidly identify, prioritize and remove the vulnerabilities standing in the way of software excellence.

To deliver a single source of truth on AppSec risk, ZeroNorth DevSecOps Analytics and Reporting ingests vulnerability data from a wide variety of AppSec scanning tools and automatically normalizes it into a common risk framework. It then dedupes, aggregates, correlates and compresses related issues to minimize noise. Through this process, ZeroNorth DevSecOps Analytics and Reporting transforms disparate data into meaningful, detailed insights and actionable business intelligence on AppSec risk at the enterprise level, as well as for specific business units, product lines, applications and even DevOps pipelines.

Key Benefits

- Provide enterprise visibility of AppSec together with a robust foundation for risk management
- Deliver actionable insights to enable Security and Engineering to collaborate and drive DevSecOps
- Enable shared responsibility and accountability for AppSec across the organization
- Improve productivity, increase speed to market and reduce costs by eliminating late-stage AppSec delays
- Get the data to build and measure a consistent, scalable AppSec governance program

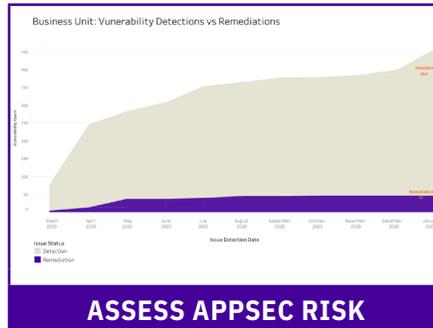

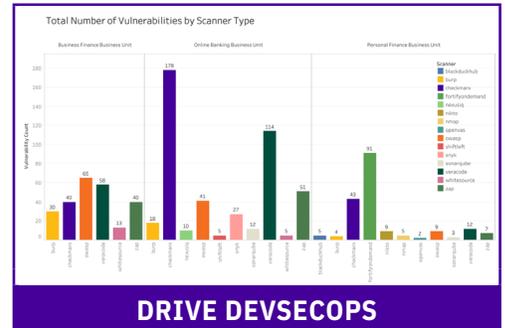

ZeroNorth DevSecOps Analytics and Reporting makes it easy for the CISO, AppSec and DevOps teams to understand, prioritize and communicate application risk across the organization.

- Easily understand the overall security risk of business-critical applications across the organization and by business units and application teams.
- Prioritize vulnerability remediation based on security and compliance considerations, delivery timeframes and revenue projections.
- Assess and track compliance with regulations, and internal policies and SLAs.
- Monitor the success of the organization's security governance program.

- Get a snapshot of the top AppSec risks and identify problematic trends.
- Track the pace of vulnerabilities created and remediated to see if the organization is getting more or less vulnerable over time.
- Quickly isolate the weakest points in the security posture.
- Gain a true picture of scanning coverage across all the applications in production, and pinpoint any gaps.

- Track vulnerabilities throughout the SDLC to identify bottlenecks that impact productivity, release schedules and software quality.
- Compare AppSec risk of proprietary and third-party/open source code.
- Find vulnerabilities affecting multiple applications and determine if any process changes or training are required to fix the root cause of any systemic security risks.
- Zero in on any problems with a specific application, DevOps pipeline or team.

ZeroNorth brings security, DevOps and the business together to improve application security performance and reduce organizational risk. The company's DevSecOps platform enables organizations to automate and orchestrate key components of their application security program, and to rapidly identify, prioritize and remove the vulnerabilities standing in the way of software excellence. In an age where the security of applications needs to be everyone's responsibility, ZeroNorth is where organizations come together for the good of software.
